

IN THE CLAIMS

Please amend the claims as follows:

Claims 1-5 (Cancelled).

Claim 6 (Currently Amended): A drive power transmission device comprising  
first and second cylindrical rotary members coaxially arranged to be rotatable relative  
to each other;

a main clutch mechanism composed of plural main outer plates rotatable bodily with  
said first cylindrical rotary member and plural main inner plates rotatable bodily with said  
second cylindrical rotary member, said main outer plates being arranged in alternate fashion  
with said main inner plates each for friction contact with said main inner plates adjacent  
thereto;

an electromagnetic type pilot clutch mechanism comprising an armature and an  
electromagnet composed of a pilot outer plate rotatable bodily with said first cylindrical  
rotary member and a pilot inner plate engageable with said pilot outer plate for rotatable  
therewith, said electromagnetic type pilot clutch mechanism including an electromagnet unit  
for bringing said pilot outer and inner plates into friction contact with each other for  
attracting said armature thereto; and a cam mechanism operable upon operation of said  
electromagnetic type pilot clutch mechanism receiving the rotational torque of said pilot inner  
plate for bringing said main outer and inner plates into friction contact,

wherein said ~~electromagnet unit and said pilot outer and inner plates include~~  
electromagnetic type pilot clutch mechanism further comprises means for generating a clutch  
magnetic path whose magnetic flux passes to reciprocate plural times across ~~said pilot outer  
and inner plates~~ of said electromagnetic type pilot clutch mechanism,

wherein the device further comprises a magnetic flux isolation member made of a non-magnetic material and formed with a circular groove on a surface thereof directed to said armature,

wherein circular slits are formed in said armature.

Claim 7-11 (Cancelled).

Claim 12 (New): A device according to claim 6, wherein said electromagnetic type pilot clutch mechanism further comprises a pilot inner plate, and

arc slits are formed in said pilot inner plate on at least triple circles whose outermost and innermost circles respectively correspond in diameter to said magnetic flux isolation member.

Claim 13 (New): The device according to claim 6, wherein said electromagnetic type pilot clutch mechanism further comprises pilot outer plates, and

arc slits are formed in said pilot outer plate on at least triple circles whose outermost and innermost circles respectively correspond in diameter to said magnetic flux isolation member.

Claim 14 (New): The device according to claim 6, wherein said circular groove is defined by outer and inner cylindrical isolation portions arranged coaxially with each other.

Claim 15 (New): The device according to claim 14, wherein said electromagnetic type pilot clutch mechanism further comprises a pilot inner plate, and

arc slits are formed in said pilot inner plate on at least triple circles whose outermost and innermost circles respectively correspond in diameter to said outer and inner cylindrical portions of said magnetic flux isolation member,

said magnetic flux isolation member being arranged in axial alignment with said pilot inner plate, with said outer and inner cylindrical portions respectively facing said arc slits on said outermost circle and said arc slits on said innermost circle of said pilot inner plate.

Claim 16 (New): The device according to claim 15, wherein said electromagnetic type pilot clutch mechanism further comprises pilot outer plates, and

arc slits are formed in said pilot outer plates on at least triple circles whose outermost and innermost circles respectively correspond in diameter to said outer and inner cylindrical portions of said magnetic flux isolation member,

said magnetic flux isolation member being arranged in axial alignment with said pilot outer plate, with said outer and inner cylindrical portions respectively facing said arc slits on said outermost circle and said arc slits on said innermost circle of said pilot outer plate.

Claim 17 (New): The device according to claim 12, wherein said pilot inner plate is given diamond-like carbon surface treatment or soft-nitriding surface treatment.

Claim 18 (New): The device according to claim 12, wherein said pilot outer plate is given diamond-like carbon surface treatment or soft-nitriding surface treatment.

Claim 19 (New): The device according to claim 6, wherein the electromagnetic type pilot clutch mechanism has an inner cylindrical portion and outer cylindrical portion, the

magnetic flux isolation member is interposed between the inner and outer cylindrical portions.

Claim 20 (New): The device according to claim 19, wherein the magnetic flux isolation member is made of stainless steel and welded to the inner and outer cylindrical portions.

Claim 21 (New): The device according to claim 19, wherein the magnetic flux isolation member is made of copper and cast between the inner and outer cylindrical portions.
